

(5, 2) - Formal Languages

Violeta Manevska¹, Donco Dimovski²

Abstract – The aim of this paper is to define a (5,2)-semigroup automata on free (5,2)-semigroup, with a special attention on (5,2)-formal languages recognizable by them.

Keywords - (5,2)-semigroup, (5,2)-semigroup automaton, (5,2)-language

I. INTRODUCTION

Our goal in writing this talk is to examine a (5,2)-formal language and to prove some properties about them. In that means, we are given an example.

II. (5,2)-SEMIGROUPS AND (5,2)-SEMIGROUP AUTOMATA

Here we recall the necessary definitions and known results. From now on, let B be a nonempty set and let (B, \cdot) be a semigroup, where \cdot is a binary operation.

A **semigroup automaton** is a triple $(S, (B, \cdot), f)$, where S is a set, (B, \cdot) is a semigroup, and $f : S \times B \rightarrow S$ is a map satisfying

$$f(f(s, x), y) = f(s, x \cdot y), \tag{1}$$

for every $s \in S, x, y \in B$.

The set S is called the set of **states** of $(S, (B, \cdot), f)$ and f is called the **transition function** of $(S, (B, \cdot), f)$.

A nonempty set B with the (5,2)-operation $\{ \} : B^5 \rightarrow B^2$ is called a **(5,2)-semigroup** iff the following equality

$$\{ \{x_1^5\}x_6^8 \} = \{x_1\{x_2^6\}x_7^8\} = \{x_1^2\{x_3^7\}x_8\} = \{x_1^3\{x_4^8\}\} \tag{2}$$

is an identity for every $x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8 \in B$. It is denoted with the pair $(B, \{ \})$.

Example 1: Let $B = \{a, b\}$. Then the (5,2)-semigroup $(B, \{ \})$ is given by Table 1.

This example of (5,2)-semigroup is generated by an appropriate computer program.

A **(5,2)-semigroup automaton** is a triple $(S, (B, \{ \}), f)$ where S is a set, $(B, \{ \})$ is a (5,2)-semigroup, and $f : S \times B^4 \rightarrow S \times B$ is a map satisfying

$$f(f(s, x_1^4), y_1^3) = f(s, \{x_1^4 y_1\}, y_2^3) =$$

$$= f(s, x_1, \{x_2^4 y_1^2\}, y_3) = f(s, x_1^2, \{x_3^4 y_1^3\}), \tag{3}$$

for every $s \in S, x_1, x_2, x_3, x_4, y_1, y_2, y_3 \in B$.

The set S is called the set of **states** of $(S, (B, \{ \}), f)$ and f is called the **transition function** of $(S, (B, \{ \}), f)$.

2.1⁰ Let $(S, (B, \cdot), \varphi)$ be a semigroup automaton. Then $(S, (B, \{ \}), f)$ is a (5,2)-semigroup automaton with (5,2)-operation $\{ \} : B^5 \rightarrow B^2$ defined by

$$\{x_1^5\} = (x_1 \cdot x_2 \cdot x_3 \cdot x_4, x_5)$$

and the transition function $f : S \times B^4 \rightarrow S \times B$ defined by

$$f(s, x_1^4) = (\varphi(s, x_1 \cdot x_2 \cdot x_3, x_4), x_4). \blacksquare$$

2.2⁰. If $(S, (B, \{ \}), f)$ is a (5,2)-semigroup automaton, then for every $c \in B$:

i) $(B^2, *_c)$ is a semigroup, where the operation $*_c$ is defined by $(x, y) *_c (u, v) = \{xycuv\}$ for every $(x, y), (u, v) \in B^2$;

(ii) $(S, (B^2, *_c), \psi)$ is a semigroup automaton, where the transition function $\psi: S \times B \times B^2 \rightarrow S \times B$ is defined by $\psi((s, a), (x, y)) = f(s, a, x, y, c)$. ■

Example 2: Let $(B, \{ \})$ be a (5,2)-semigroup given by Table 1 from Example 1 and $S = \{s_0, s_1, s_2\}$. A (5,2)-semigroup automaton $(S, (B, \{ \}), f)$ is given by Table 2 and the graph in Fig. 1.

This example of (5,2)-semigroup automaton is generated by computer.

III. FREE (5,2)-SEMIGROUPS AND (5,2)-SEMIGROUP AUTOMATA ON THEM

Let B be a nonempty set. We define a sequence of sets $B_0, B_1, \dots, B_p, B_{p+1}, \dots$ by induction as follows:

$$B_0 = B.$$

Let B_p be defined, and let A_p be the subset of B_p of all the elements $u_1^{2+3s}, u_\alpha \in B_p, s \geq 1$. Define B_{p+1} to be $B_{p+1} = B_p \cup A_p \times \{1, 2\}$.

Let $\bar{B} = \bigcup_{p \geq 0} B_p$. Then $u \in \bar{B}$ iff $u \in B$ or $u = (u_1^{2+3s}, i)$ for some $u_\alpha \in \bar{B}, s \geq 1, i \in \{1, 2\}$.

Define a length for elements of \bar{B} , i.e. a map $|\cdot|: \bar{B} \rightarrow N$ (N is a set of positive integers) as follows:

Fig. 1 (5,2)-semigroup automaton

1⁰ If $u \in B$, then $|u| = 1$;

2⁰ If $u = (u_1^{2+3s}, i)$, then $|u| = |u_1| + |u_2| + \dots + |u_{2+3s}|$.

By induction on the length we are going to define a map $\varphi: \bar{B} \rightarrow \bar{B}$. For $b \in B$, let $\varphi(b) = b$. Let $u \in \bar{B}$ and suppose that for each $v \in \bar{B}$ with $|v| < |u|$, $\varphi(v) \in \bar{B}$ and

(1) If $\varphi(v) \neq v$, then $|\varphi(v)| < |v|$;

(2) $\varphi(\varphi(v)) = \varphi(v)$.

Let $u = (u_1^{2+3s}, i)$. Then, for each α , $\varphi(u_\alpha) = v_\alpha \in \bar{B}$ is defined, $|\varphi(u_\alpha)| \leq |u_\alpha|$ and $\varphi(\varphi(u_\alpha)) = \varphi(u_\alpha)$. Let $v = (v_1^{2+3s}, i)$.

(i) If for some α , $u_\alpha \neq v_\alpha$, then $|v_\alpha| < |u_\alpha|$, and so, $|v| < |u|$. In this case let $\varphi(u) = \varphi(v)$.

Because $|v| < |u|$, it follows that $\varphi(v)$ is defined, and moreover, (1) and (2) imply that

$$|\varphi(u)| = |\varphi(v)| \leq |v| < |u|, \varphi(u) \neq u \text{ and } \varphi(\varphi(u)) = \varphi(\varphi(v)) = \varphi(v) = \varphi(u).$$

(ii) Let $u_\alpha = v_\alpha$ for each α . Then $u = v$. Suppose that there is $j \in \{0, 1, \dots, 3s\}$ and $r \geq 1$, such that

$u_{j+v} = (w_1^{3r+2}, i)$ for each $v \in \{1, 2\}$ and let t be the smallest such j . In this case, let

$$\varphi(u) = \varphi(u_1^t w_1^{3r+2} u_{t+4}^{3s+2}, i).$$

Because $\left| (u_1^r w_1^{3r+2} u_{r+4}^{3s+2}, i) \right| < |u|$ it follows that $\varphi(u)$ is well defined, and moreover, (1) and (2) imply that $\varphi(u) \neq u$, $|\varphi(u)| < |u|$ and $\varphi(\varphi(u)) = \varphi(u)$.

(iii) If $\varphi(u)$ can't be defined by (i) or (ii), let $\varphi(u) = u$. In this case, $\varphi(\varphi(u)) = \varphi(u) = u$ and $|\varphi(u)| = |u|$.

The above discussion and (i), (ii) and (iii) complete the inductive step, and so we have defined a map $\varphi : \bar{B} \rightarrow \bar{B}$.

Moreover, we have proved the following:

Lemma: (a) For $b \in B$, $\varphi(b) = b$;

(b) For each $u \in \bar{B}$, $|\varphi(u)| \leq |u|$;

(c) For $u \in \bar{B}$, if $\varphi(u) \neq u$, then $|\varphi(u)| < |u|$;

(d) For each $u \in \bar{B}$, $\varphi(\varphi(u)) = \varphi(u)$. ■

Now, let $Q = \varphi(\bar{B})$. By Lemma (d),

$$Q = \{u \mid u \in \bar{B}, \varphi(u) = u\}.$$

Define a map $[\] : Q^5 \rightarrow Q^2$, by $[u_i^5] = (v_i^2)$

$$\Leftrightarrow v_i = \varphi(u_i^5, i) \text{ for each } i \in \{1, 2\}.$$

Because $u_j \in Q$, it follows that $(u_i^5, i) \in \bar{B}$, and so $\varphi(u_i^5, i) \in Q$ for each $i \in \{1, 2\}$. Hence $[\]$ is well defined.

Theorem: $(Q, [\])$ is a free (5,2)- semigroup with a basis B . ■

Let $(S, (B, \{ \}), f)$ be a (5,2)-semigroup automaton.

Now, we define a sequence of maps

$\psi_0, \psi_1, \dots, \psi_p, \psi_{p+1}, \dots$ for a sequence of sets

$B_0, B_1, \dots, B_p, B_{p+1}, \dots$ by induction as follows:

$\psi_0 : B_0 \rightarrow B_0$ with $\psi_0(b) = b$, for each $b \in B_0$;

$\psi_1 : B_1 \rightarrow B_0$ with $\psi_1(b_1^n, i) = \{b_1^n\}_i$;

$\psi_2 : B_2 \rightarrow B_0$ with $\psi_2(u_1^n, i) = \{\psi_1(u_1) \dots \psi_1(u_n)\}_i$;

⋮

$\psi_p : B_p \rightarrow B_0$ with

$$\psi_p(u_1^n, i) = \{\psi_{p-1}(u_1) \dots \psi_{p-1}(u_n)\}_i$$

⋮

Because $\bar{B} = \bigcup_{p \geq 0} B_p$, we define a map $\psi : \bar{B} \rightarrow B_0$ with

$\psi(u) = \psi_p(u)$ for $u \in \bar{B}$ and $|u| \leq p$. Now we will prove that ψ is well defined. If

$$u = (u_1^r (w_1^{2+3s}, i_1) (w_1^{2+3s}, i_2) u_{r+3}^{2+3t}, i),$$

$$v = (u_1^r w_1^{2+3s} u_{r+3}^{2+3t}, i)$$

and $\varphi(u) = \varphi(v)$, we have to prove that $\psi(u) = \psi(v)$.

We have

$$\psi(u) = \psi_p(u) =$$

$$= \psi_p(u_1^r (w_1^{2+3s}, i_1) (w_1^{2+3s}, i_2) u_{r+3}^{2+3t}, i) =$$

$$= \{\psi_{p-1}(u_1) \dots \psi_{p-1}(u_r) \psi_{p-1}(w_1^{2+3s}, i_1) \psi_{p-1}(w_1^{2+3s}, i_2) \dots$$

$$\psi_{p-1}(u_{r+3}) \dots \psi_{p-1}(u_{2+3t})\}_i =$$

$$= \{\psi_{p-1}(u_1) \dots \psi_{p-1}(u_r) \{\psi_{p-2}(w_1) \dots \psi_{p-2}(w_{2+3s})\}_{i_1} \dots$$

$$\{\psi_{p-1}(w_1) \dots \psi_{p-2}(w_{2+3s})\}_{i_2} \psi_{p-1}(u_{r+3}) \dots \psi_{p-1}(u_{2+3t})\}_i =$$

$$= \{\psi_{p-1}(u_1) \dots \psi_{p-1}(u_r) \psi_{p-1}(w_1) \dots \psi_{p-1}(w_{2+3s})$$

$$\psi_{p-1}(u_{r+3}) \dots \psi_{p-1}(u_{2+3t})\}_i.$$

Also,

$$\psi(v) = \psi_p(v) = \psi_p(u_1^r w_1^{2+3s} u_{r+3}^{2+3t}, i) =$$

$$= \{\psi_{p-1}(u_1) \dots \psi_{p-1}(u_r) \psi_{p-1}(w_1) \dots \psi_{p-1}(w_{2+3s})$$

$$\psi_{p-1}(u_{r+3}) \dots \psi_{p-1}(u_{2+3t})\}_i.$$

Hence $\psi(u) = \psi(v)$. On the other hand, $Q = \varphi(\bar{B})$, so it follows that the restriction of ψ on Q is well defined.

Now again, we define a sequence of maps

$\tau_0, \tau_1, \dots, \tau_p, \tau_{p+1}, \dots$ for a sequence of sets

$B_0, B_1, \dots, B_p, B_{p+1}, \dots$ by induction as follows:

$\tau_0 : S \times B_0^4 \rightarrow S \times B_0$ with $\tau_0(s, x_1^4) = f(s, x_1^4)$;

$\tau_1 : S \times B_1^4 \rightarrow S \times B_1$ with

$$\tau_1(s, (u_{11}^{1\alpha_1}, i_1), (u_{21}^{2\alpha_2}, i_2), (u_{31}^{3\alpha_3}, i_3), (u_{41}^{4\alpha_4}, i_4)) =$$

$$f(s, \psi_1(u_{11}^{1\alpha_1}, i_1), \psi_1(u_{21}^{2\alpha_2}, i_2), \psi_1(u_{31}^{3\alpha_3}, i_3), \psi_1(u_{41}^{4\alpha_4}, i_4))$$

$\tau_2 : S \times B_2^4 \rightarrow S \times B_2$ with

$$\tau_2(s, (u_{11}^{1\alpha_1}, i_1), (u_{21}^{2\alpha_2}, i_2), (u_{31}^{3\alpha_3}, i_3), (u_{41}^{4\alpha_4}, i_4)) =$$

$$f(s, \psi_2(\bar{u}_{11}^{1\alpha_1}, i_1), \psi_2(\bar{u}_{21}^{2\alpha_2}, i_2), \psi_2(\bar{u}_{31}^{3\alpha_3}, i_3), \psi_2(\bar{u}_{41}^{4\alpha_4}, i_4))$$

⋮

$\tau_p : S \times B_p^4 \rightarrow S \times B_p$ with

$$\tau_p(s, (u_{11}^{1\alpha_1}, i_1), (u_{21}^{2\alpha_2}, i_2), (u_{31}^{3\alpha_3}, i_3), (u_{41}^{4\alpha_4}, i_4)) =$$

$$f(s, \psi_p(\bar{u}_{11}^{1\alpha_1}, i_1), \psi_p(\bar{u}_{21}^{2\alpha_2}, i_2), \psi_p(\bar{u}_{31}^{3\alpha_3}, i_3), \psi_p(\bar{u}_{41}^{4\alpha_4}, i_4))$$

⋮

Now we define a map τ for the sequence of maps

$\tau_0, \tau_1, \dots, \tau_p, \tau_{p+1}, \dots$ by $\tau : S \times \bar{B}^4 \rightarrow S \times \bar{B}$, so that

$\tau|_{B_p} = \tau_p$ and

$$\tau(s, (u_{11}^{1\alpha_1}, i_1), (u_{21}^{2\alpha_2}, i_2), (u_{31}^{3\alpha_3}, i_3), (u_{41}^{4\alpha_4}, i_4)) =$$

$$\tau_p(s, (u_{11}^{1\alpha_1}, i_1), (u_{21}^{2\alpha_2}, i_2), (u_{31}^{3\alpha_3}, i_3), (u_{41}^{4\alpha_4}, i_4)) =$$

$$f(s, \psi_p(u_{11}^{1\alpha_1}, i_1), \psi_p(u_{21}^{2\alpha_2}, i_2), \psi_p(u_{31}^{3\alpha_3}, i_3), \psi_p(u_{41}^{4\alpha_4}, i_4)) =$$

$$f(s, \psi(u_{11}^{1\alpha_1}, i_1), \psi(u_{21}^{2\alpha_2}, i_2), \psi(u_{31}^{3\alpha_3}, i_3), \psi(u_{41}^{4\alpha_4}, i_4)).$$

Because ψ is well defined, it follows that τ is well defined. On the other hand, $Q = \varphi(\bar{B})$ so $\bar{\varphi}$ denotes the map $\bar{\varphi} : S \times Q^4 \rightarrow S \times Q$ defined by

$$\begin{aligned} \bar{\varphi}(s, (u_{11}^{1\alpha_1}, i_1), (u_{21}^{2\alpha_2}, i_2), (u_{31}^{3\alpha_3}, i_3), (u_{41}^{4\alpha_4}, i_4)) &= \\ = \tau(s, (u_{11}^{1\alpha_1}, i_1), (u_{21}^{2\alpha_2}, i_2), (u_{31}^{3\alpha_3}, i_3), (u_{41}^{4\alpha_4}, i_4)) &= \\ = f(s, \psi(u_{11}^{1\alpha_1}, i_1), \psi(u_{21}^{2\alpha_2}, i_2), \psi(u_{31}^{3\alpha_3}, i_3), \psi(u_{41}^{4\alpha_4}, i_4)). \end{aligned}$$

Moreover, $(S, (Q, [\]), \bar{\varphi})$ is a (5,2)-semigroup automaton, where $(Q, [\])$ is a free (5,2)-semigroup with a basis B .

IV. RECOGNIZABLE (5,2)-LANGUAGES

Any subset $L^{(5,2)}$ of the universal language $Q^* = \bigcup_{p \geq 1} Q^p$, where Q is a free (5,2)-semigroup with a basis B , is called a **(5,2)-language (formal (5,2)-language)** on the alphabet B .

A (5,2)-language $L^{(5,2)} \subseteq Q^*$ is called **recognizable** if there exists:

(1) a (5,2)-semigroup automaton $(S, (B, \{ \}), f)$, where the set S is finite;

(2) an initial state $s_0 \in S$;

(3) a subset $T \subseteq S$ such that

$$L^{(5,2)} = \{w \in Q^* \mid \bar{\varphi}(s_0, (w, 1), (w, 2)) \in T\},$$

where $(S, (Q, [\]), \bar{\varphi})$ is the (5,2)-semigroup automaton constructed above, for the (5,2)-semigroup automaton $(S, (B, \{ \}), f)$.

We also say that the (5,2)-semigroup automaton $(S, (B, \{ \}), f)$ **recognizes** $L^{(5,2)}$, or that $L^{(5,2)}$ **is recognized** by $(S, (B, \{ \}), f)$.

Example 3: Let $(S, (B, \{ \}), f)$ be a (5,2)-semigroup automaton given in Example 2. We construct the (5,2)-semigroup automaton $(S, (Q, [\]), \bar{\varphi})$ for the (5,2)-semigroup automaton $(S, (B, \{ \}), f)$.

A (5,2)-language $L^{(5,2)}$, which is recognized by the (5,2)-semigroup automaton $(S, (Q, [\]), \bar{\varphi})$, with initial state s_0 and terminal state (s_1, a) is

$$L^{(5,2)} = \{w \in Q^* \mid w = w_1 w_2 \dots w_q, \quad q \geq 5, \quad \text{where}$$

$$w_l = \begin{cases} (u_1^n, i), & n \geq 5, u_\alpha \in Q \\ (a^* b^*)^* & , l \in \{1, 2, \dots, q\}, \text{ and:} \end{cases}$$

a) If $i = 1$, then:

a1) $(u_1^n, 1) = a$, where

$$\psi_{p-1}(u_1) \dots \psi_{p-1}(u_n) = a(a \cup b)(a^t b^l a^h)^*,$$

a2) $(u_1^n, 1) = b$, where

$$\psi_{p-1}(u_1) \dots \psi_{p-1}(u_n) = b(a \cup b)(a^t b^l a^h)^*$$

b) If $i = 2$, then:

b1) $(u_1^n, 2) = a$, where

$$\psi_{p-1}(u_1) \dots \psi_{p-1}(u_n) = (a \cup b)a(a^t b^l a^h)^*,$$

b2) $(u_1^n, 2) = b$, where

$$\psi_{p-1}(u_1) \dots \psi_{p-1}(u_n) = (a \cup b)b(a^t b^l a^h)^*,$$

and $\psi_p(w_1) \dots \psi_p(w_q) = (a \cup b)a(a \cup b)^2(a^t b^l a^h)^*$, for $t + l + h = 3k$, $t, l, h \in \{0, 1, 2, \dots\}$, $k \geq 1$, $q = 3k + 4$ }.

4.1⁰ Let $L^{(5,2)}$ be a (5,2)-language on the set B recognized by (5,2)-semigroup automaton $(S, (Q, [\]), \bar{\varphi})$. Let $(S, (Q, [\]), \bar{\varphi})$ be a (5,2)-semigroup automaton with initial state s_0 and a set of terminal states $T \times C \subseteq S \times B$. Then $x\tilde{L}^{(2,1)}c \subseteq L^{(5,2)}$ for each $x \in Q$ and for any language $L^{(2,1)}$, which is recognized by the semigroup automaton $(S \times Q, (Q^2, *_c), \psi)$ with an initial state $s'_0 = (s_0, x)$, a set of terminal states $T \times C$, where $\psi : S \times Q \times Q^2 \rightarrow S \times Q$ is a transition function defined by $\psi((s, x), y_1^2) = \bar{\varphi}(s, x, y_1^2, c)$ for $c \in Q^p$ and p is the least non-negative integer, such that $2 + p \equiv 0 \pmod{3}$, and $\tilde{L}^{(2,1)} = \{\tilde{w} \mid w \in L^{(2,1)}\}$.

Proof: $L^{(5,2)}$ is a recognizable (5,2)-language on the set B by the (5,2)-semigroup automaton $(S, (Q, [\]), \bar{\varphi})$ with an initial state s_0 and a set of terminal states $T \times C \subseteq S \times B^{n-t}$, so

$$L^{(5,2)} = \{w \in Q^* \mid w = w_1 w_2 \dots w_{3q+4}, \quad q \geq 1 \text{ and}$$

$$\bar{\varphi}(s_0, (w_1^{3q+2}, 1), (w_1^{3q+2}, 2), \psi_{p-1}(w_{3q+3}), \psi_{p-1}(w_{3q+4})) =$$

$$\bar{\varphi}(s_0, \psi_{p-1}(w_1), (w_2^{3q+3}, 1), (w_2^{3q+3}, 2), \psi_{p-1}(w_{3q+4})) =$$

$$\bar{\varphi}(s_0, \psi_{p-1}(w_1), \psi_{p-1}(w_2), (w_3^{3q+4}, 1), (w_3^{3q+4}, 2)) \in T \times C \}.$$

By Proposition 2.2⁰, $(S \times Q, (Q^2, *_c), \psi)$ is a semigroup automaton. It recognizes a language $L^{(2,1)}$ with a set of initial states $s'_0 = (s_0, x)$ and a set of terminal states $T \times C$, so it is of the form

$$L^{(2,1)} = \{w \in (Q^2)^* \mid \psi(s'_0, w) \in T \times C\}.$$

Let $w \in L^{(2,1)}$. It follows that $w \in (Q^2)^*$ and $\psi(s'_0, w) \in T \times C$. But $s'_0 = (s_0, x)$, so

$$\begin{aligned} \bar{\varphi}(s_0, x, (\tilde{w}, 1), (\tilde{w}, 2), c) &= \bar{\varphi}(s_0, x, w, c) = \\ &= \psi((s_0, x), w) = \psi(s'_0, w) \in T \times C \end{aligned}$$

Thus $x\tilde{w}c \in L^{(5,2)}$, i.e. $x\tilde{L}^{(2,1)}c \subseteq L^{(5,2)}$. ■

4.2⁰ Let $L^{(2,1)}$ be a recognizable language on the set B by a semigroup automaton $(S, (B, \|\ \|), \xi)$ with an initial state $s_0 \in S$ and a set of terminal states $T \subseteq S$, and $(S, (B, \{ \}), f)$ be an (5,2)-semigroup automaton constructed by a semigroup automaton $(S, (B, \|\ \|), \xi)$. Let $f : S \times B^4 \rightarrow S \times B$ is a transition function defined by $f(s, x_1^4) = (\xi(s, \|x_1^3\|), x_4)$. Then $L^{(2,1)}a \subseteq L^{(5,2)}$, for each $a \in B$, where $L^{(5,2)}$ is a recognizable (5,2)-language on the set B by the (5,2)-semigroup automaton $(S, (Q, [\]), \bar{\varphi})$ with an initial state $s_0 \in S$ and a set of terminal states $T \times \{a\}$.

Proof: A language $L^{(2,1)}$ is recognizable by a semigroup automaton $(S, (B, \|\ \|), \xi)$ with initial state $s_0 \in S$ and a set of terminal states $T \subseteq S$, so

$$L^{(2,1)} = \{w \in B^* \mid \xi(s_0, w) \in T\}.$$

By Proposition 2.1⁰, $(S, (B, \{ \}), f)$ is a (5,2)-semigroup automaton. We construct an (5,2)-semigroup automaton $(S, (Q, [\]), \bar{\varphi})$, where $Q = \varphi(\bar{B})$ and $\bar{\varphi} : S \times Q^4 \rightarrow S \times Q$ is a transition function defined by

$$\begin{aligned} \bar{\varphi}(s, (u_{11}^{1\alpha_1}, i_1), (u_{21}^{2\alpha_2}, i_2), (u_{31}^{3\alpha_3}, i_3), (u_{41}^{4\alpha_4}, i_4)) = \\ = f(s, \psi_p(u_{11}^{1\alpha_1}, i_1), \psi_p(u_{21}^{2\alpha_2}, i_2), \psi_p(u_{31}^{3\alpha_3}, i_3), \psi_p(\bar{u}_{41}^{4\alpha_4}, i_4)). \end{aligned}$$

It follows that a recognizable (5,2)-language $L^{(5,2)}$ on the set B by (5,2)-semigroup automaton $(S, (Q, [\]), \bar{\varphi})$, with initial state $s_0 \in S$ and a set of terminal states $T \times \{a\}$ is of the form

$$L^{(5,2)} = \{w \in Q^* \mid w = w_1 w_2 \dots w_{3q+4}, q \geq 1 \text{ and}$$

$$\begin{aligned} \bar{\varphi}(s_0, (w_1^{3q+2}, 1), (w_1^{3q+2}, 2), \psi_{p-1}(w_{3q+3}), \psi_{p-1}(w_{3q+4})) = \\ = \bar{\varphi}(s_0, \psi_{p-1}(w_1), (w_2^{3q+3}, 1), (w_2^{3q+3}, 2), \psi_{p-1}(w_{3q+4})) = \\ = \bar{\varphi}(s_0, \psi_{p-1}(w_1), \psi_{p-1}(w_2), (w_3^{3q+4}, 1), (w_3^{3q+4}, 2)) \in T \times C \}. \end{aligned}$$

Let $w \in L^{(2,1)}$, $|w| \geq 3q+3$ i.e. $w = w_1^{3q+3}$, $q \geq 1$ and $a \in B$. Then

$$\begin{aligned} \bar{\varphi}(s_0, (w_1^{3q+2}, 1), (w_1^{3q+2}, 2), \psi_{p-1}(w_{3q+3}), a) = \\ = \bar{\varphi}(s_0, (w, a)) = (\xi(s_0, w), a) \in T \times \{a\}. \end{aligned}$$

Thus $wa \in L^{(5,2)}$, i.e. $L^{(2,1)}a \subseteq L^{(5,2)}$. ■

V. CONCLUSION

The results was given in this paper, are of the scientific interest, because there was defined a (5,2)-languages as a consequence of the generalization of the semigroup automata in case (5,2). Also, here was given the conection between (2,1)-languages and (5,2)-languages.
